Abstract

Problem -based learning is "Problem"....." based" "learning". Let us look at each of these words. A problem is something that is problematic to the student; something that cannot be resolved with the current level of knowledge and/or way of thinking about the issues. The nature of effective problems in problem-based learning is that they are ill-structured as opposed to well structured. The characteristics of ill-structured problems are that they are real-life and authentic but not teacher's exercises, messy not tidy, incomplete in the sense of lacking information needed for their resolution and iterative in the way that they produce further ideas,/hypotheses and learning issues (Barrows 1989; Stephen and Pyke 1977; Margeston 2001). It is vital that the problems are engaging , that they "smell real", are interesting and challenging to students. This engagement stimulates further learning and requires research, elaboration, further analysis and synthesis together with decisions and action plans. The engineering profession requires engineers to deal with uncertainty and solve complex problems of the field, sometimes with incomplete data (Mills Treagust, 2003; NAE, 2004). In addition, engineers need to be able to function as effective members of teams and have strong communication and problem-solving skills (NAE, 2004). However, today's engineering graduates lack these skills and have difficulty applying their fundamental knowledge to problems of practice (

Index terms— PBL, Learning, Cooperative, Self directed, Well Structured, Deep Content, Knowledge, grounded

Let us look at each of these words. A problem is something that is problematic to the student; something that cannot be resolved with the current level of knowledge and/or way of thinking about the issues. The nature of effective problems in problem-based learning is that they are illstructured as opposed to well structured. The characteristics of ill-structured problems are that they are real-life and authentic but not teacher's exercises, messy not tidy, incomplete in the sense of lacking information needed for their resolution and iterative in the way that they produce further ideas,/hypotheses and learning issues (Barrows 1989; Stephen and Pyke 1977; Margeston 2001). It is vital that the problems are engaging , that they "smell real", are interesting and challenging to students. This engagement stimulates further learning and requires research, elaboration, further analysis and synthesis together with decisions and action plans.

The engineering profession requires engineers to deal with uncertainty and solve complex problems of the field, sometimes with incomplete data ??Mills & Treagust, 2003; ??AE, 2004). In addition, engineers need to be able to function as effective members of teams and have strong communication and problem-solving skills ??NAE, 2004). However, today's engineering graduates lack these skills and have difficulty applying their fundamental knowledge to problems of practice ??Mills & Treagust, 2003; ??AE, 2005; ??guyen, 1998; ??ergara, et al., 2009).

The main problem within engineering education is the gap between the active field and the passive classroom experience ??Palmquist, 2007). In general, the traditional lecture method within engineering education is

Problem-based Learning Influence on Students Learning in an Electronics Communication Engineering Course

44 deductive, "beginning with theories and progressing towards application of those theories" and the instructor
45 presents information without a discussion of why the mathematical models are being developed and what practical
46 problems they will solve ??Prince & Felder, 2006). and not specific to the situation in which the task needs to
47 take place. This pedagogical approach falls short because the knowledge is not grounded. Dewey suggested
48 that educators needed to encourage inquiry and that education should be grounded on experience and linked
49 to real-life activities in order to motivate and develop students into upstanding citizens. The problem-based
50 learning ??PBL) has the potential to help students to cope with the demands of complexities of the field and
51 problems they will face in their future careers. This appears initially to make complex tasks more manageable;
52 but we pay a hidden price: we can no longer see the consequences of our actions, and we lose our intrinsic sense
53 of connection to a larger whole. When we want to see the big picture, we try to reassemble the fragments and
54 organize all the pieces. The task is futile-similar to trying to reassemble the fragments of a broken mirror!

55 In addition, while science and engineering jobs experienced annual average growth rate of 6.7% (compared
56 to 1.6% for total employment) between 1950-2000, the attrition rate for students has steadily increased and the
57 annual graduation rate decreased by 20%, ??Felder, Felder, & Dietz, 1998; ??SB, 2008). One of the complaints
58 from engineering students is that the current teaching pedagogies (such as, traditional lecture format) emphasize
59 explicit instruction, working individually, and norm-reference grading, which can make learning extrinsically
60 motivating rather than intrinsically motivating ??Felder, et al., 1998). The main problem within engineering
61 education is the gap between the active field and the passive classroom experience (Palmquist, 2007). To study the
62 impact of problem-based learning (PBL) on undergraduate Electronics & Communication engineering students'
63 conceptual understanding and their perceptions of learning using PBL as compared to lecture. Fifty students
64 enrolled in an Electronics & Communication course at SRMGPC, Lucknow, volunteered in this research project.
65 Results found out that participants' learning gains from PBL were much higher their gains from traditional
66 lecture

67 In general, the traditional lecture method within engineering education is deductive, "beginning with theories
68 and progressing towards application of those theories" and the instructor presents information without a
69 discussion of why the mathematical models are being developed and what practical problems they will solve
70 ??Prince & Felder, 2006). and not specific to the situation in which the task needs to take place. This pedagogical
71 approach falls short because the knowledge is not grounded. Dewey suggested that educators needed to encourage
72 inquiry and that education should be grounded on experience and linked to real-life activities in order to motivate
73 and develop students into upstanding citizens. This paper describes one such approach, problem-based learning
74 (PBL) has the potential to help students to cope with the demands of complexities of the field and problems they
75 will face in their future careers. The impact of Problem-based learning (PBL) on undergraduate Electronics &
76 Communication engineering students' conceptual understanding and their perceptions of learning using PBL were
77 compared to that of traditional lecture. Fifty students enrolled in an Electronics & Communication course at
78 SRMGPC, Lucknow, participated in this research. Results concluded that participants' learning gains from PBL
79 were much more their gains from traditional lecture. Keywords: PBL, Learning, Cooperative, Self directed, Well
80 Structured, Deep Content, Knowledge, grounded BL, or Problem Based Learning, is an instructional method of
81 group-based learning centered on utilizing each member of the group's own information, resources, and personal
82 experiences. The group must then compile their knowledge in an effort to solve the open-ended problems. What
83 makes this method of teaching interesting is that there is no one, real "right" answer. iii) Students engage
84 in independent study on their learning issues outside the tutorial. The information P sources they draw on
85 include: library, databases, and the web and resource people iv) They come back to the PBL tutorial (s) sharing
86 information, peer teaching and working together on the problem v) They present and discuss their solution to
87 the problem vi) They review what they have learnt from working on the problem. All who participated in the
88 process engage in self, peer and tutor review of the PBL process and each person's contribution to that process.
89 a) Problem-based learning is " "Problem"+"based" +"learning". Let us look at each of these words. A problem
90 is something that is problematic to the student; something that cannot be resolved with the current level of
91 knowledge and/or way of thinking about the issues. The nature of effective problems in problem-based learning
92 is that they are ill-structured as opposed to well structured. The characteristics of PBL ill-structured problems
93 are that they are real-life and authentic not teacher's exercises, messy not tidy, incomplete in the sense of lacking
94 information needed for their resolution and iterative in the way that they produce further ideas,/hypotheses
95 and learning issues (Barrows 1989; Stephen and Pyke 1977; Margeston 2001). It is vital that the problems are
96 engaging, that they "smell real", are interesting and challenging to students. This engagement stimulates further
97 learning and requires research, elaboration, further analysis and synthesis together with decisions and action
98 plans.

99 The word "problem" in problem based learning needs to be interrogated. Problems are not always about
100 something that is in difficulty that needs to be sorted out. An ill-structured design brief for an artist or an
101 architect can be a problem. A dilemma for a doctor or a challenge for an engineer can be a problem. Problems
102 are not always how to do something immediately practical in professional practice. Problems can also be about
103 how to understand something. Problems can be presented to students in a variety of formats including: scenarios,
104 puzzles, diagrams, dialogues, quotations, cartoons, e-mails, posters, poems, physical objects, and video-clips One
105 of the most important points about problems in problem-based learning is that it is not a question that first the
106 students receive inputs of knowledge e.g. lectures, practicals, handouts etc. and then "apply" this knowledge to

107 a problem they are presented with later in the learning process. This type of a situation is nor problem-based
108 learning it is problem solving (Savin-Baden 2000). It is like making a cake when you have already been given
109 the recipe and all the ingredients. One of the defining characteristics of the use of problems in problem-based
110 learning is is that students are deliberately presented with the problem at the start of the learning process. This
111 is like getting the challenge of preparing a celebratory meal for a special occasion where no recipes or ingredients
112 are given.

113 The engineering profession requires engineers to deal with uncertainty and solve complex problems of the
114 field, sometimes with incomplete data ??Mills & Treagust, 2003; ??AE, 2004). In addition, engineers need to be
115 able to function as effective members of teams and have strong communication and problem-solving skills (NAE,
116 2004). However, today's engineering graduates lack these skills and have difficulty applying their fundamental
117 knowledge to problems of practice ??Mills & Treagust, 2003; ??AE, 2005; ??guyen, 1998; ??ergara, et al., 2009).
118 In addition, while science and engineering jobs experienced annual average growth rate of 6.7% (compared to
119 1.6% for total employment) between1950-2000, the attrition rate for students has steadily increased and the
120 annual graduation rate decreased by 20%, ??Felder, Felder, & Dietz, 1998; ??SB, 2008). One of the complaints
121 from engineering students is that the current teaching pedagogies (such as, traditional lecture format) emphasize
122 explicit instruction, working individually, and norm-reference grading, which can make learning extrinsically
123 motivating rather than intrinsically motivating ??Felder, et al., 1998). The main problem within engineering
124 education is the gap between the active field and the passive classroom experience ??Palmquist, 2007).

125 In general, the traditional lecture method within engineering education is deductive, "beginning with theories
126 and progressing towards application of those theories" And the instructor presents information without a
127 discussion of why the mathematical models are being developed and what practical problems they will solve
128 ??Prince & Felder, 2006). and not specific to the situation in which the task needs to take place. ??ewey (1938)
129 argued. This pedagogical approach falls short because the knowledge is not grounded in context that such a
130 traditional learning environment is too abstract and dull, leaving students with a sense of boredom and lack
131 of motivation because they are presented with random information with no unifying factor. Instead, Dewey
132 suggested that educators needed to encourage inquiry and that education should be grounded on experience
133 and linked to real-life activities in order to motivate and develop students into upstanding citizens. Dewey also
134 equated learning with doing and viewed learning as an activity, a process of discovery, where students need to
135 be actively engaged in all aspects of the learning process (Savin-Baden, 2000).

136 Brown, Collins, and Duguid (1989) further emphasized that unless knowledge is developed in the context in
137 which it is to be used, students will gain an understanding of abstract concepts, algorithms, and procedures;
138 thus, the knowledge remains inert and students are unable to use it. Brown and colleagues stated, "the activity
139 in which knowledge is developed and deployed, is not separable from or ancillary to learning and cognition.
140 Rather it is an integral part of what is learned" (p. 32). This is even more so the case for a complex enterprise
141 such as engineering, which involves making decisions with real-world implications that carry risks and uncertain
142 outcomes.

143 The teaching in undergraduate courses in the STEM disciplines has increasingly started adopting the more
144 learner-centered teaching, such as problembased learning (Lattuca, Terenzini, Volkwein, & Peterson, 2006). This
145 shift is fueled by the need for future engineers to demonstrate the use of higher order thinking, problem solving,
146 and more interpersonal aspects of a career, such as communication, social, and team-work skills (NAE, 2005).
147 Specifically, the engineering field is seeing shifts in the types of engineers needed to emerge from college who are
148 ready to participate as active and effective members of a global society. The National Academy of Engineers
149 (NAE, 2004) developed a set of attributes future engineers will have to possess to be a competitive force within
150 the field. Hence, it is important for engineering education to reexamine the use of typical lecture-based teaching
151 methodology and consider incorporating learner-centered teaching. One such approach, problem-based learning
152 (PBL) has the potential to help students to cope with the demands of complexities of the field and problems
153 they will face in their future careers.

154 Problem-based learning (PBL) was developed in the 1950s to respond to criticism that traditional lecture failed
155 to prepare medical students for problemsolving in clinical settings (Hung, Jonassen, & Liu, 2008). PBL is a non-
156 traditional, active, inductive, student-centered approach that centers on the introduction of a real-life problem
157 (Ehrlich, 1998). The problem is "a complex task created by the need to design, create, build, repair, and/or
158 improve something" (Burgess, 2004, p. 42). The goals of PBL include fostering active learning, interpersonal and
159 collaborative skills, open inquiry, real-life problem solving, critical thinking, intrinsic motivation, and the desire
160 to learn for a lifetime (Barrows, 1998;

161 Hmelo-Silver, 2004; Savin-Baden, 2000; Springer, Stanne, & Donovan, 1999). Hmelo-Silver argued that PBL
162 allows students to construct an extensive and flexible knowledge base, which goes beyond factual knowledge,
163 allowing them to fluently retrieve and apply this knowledge in varied situations. Hence, PBL allows students
164 to move beyond the mental understanding of information and learn to apply concepts to real-life formats. In
165 addition, since the knowledge is also grounded in context, which requires the use of problem solving skills,
166 educators purport that the conceptualization of knowledge better prepares students for future careers. Research
167 on problem-based learning in the medical field has suggested that PBL leads to higher problem-solving skills as
168 compared to the traditional lecture method while being equally effective at increasing students' factual knowledge.

169 For example, Antepohl and Herzig (1999) investigated whether students learned more and were more satisfied

1 GLOBAL (F) A) PROBLEM-BASED LEARNING IN ENGINEERING EDUCATION

170 in a PBL course than a traditional lecturebased course using a post-test-only control group design. One hundred
171 and twenty-three students were randomized to either a PBL section (N _63) or lecturebased section (N _60)
172 of the same pharmacology course. All participants completed a written examination for pharmacology, which
173 included 20 multiplechoice and 10 short answer questions to measure student performance, and a questionnaire
174 that measured students' preferences for PBL or lecture-based instruction. The PBL group also completed a second
175 questionnaire to assess their satisfaction with the PBL approach. The authors found no significant difference
176 between the PBL and lecture students on the multiplechoice questions, but PBL students scored significantly
177 higher than lecture students on the short answer questions. In addition, greater numbers of students preferred
178 the PBL approach and PBL students also reportedhigher overall satisfaction for the course as compared to the
179 control group. These results demonstrate that PBL provides similar learning benefits to lecture in terms of
180 factual knowledge; however, PBL also leads to gains in complex levels of knowledge, such as comprehension and
181 analysis of problems. Similar results were supported by a meta-analysis conducted to investigate the effects of
182 problem-based learning in terms of impact on knowledge and skill acquisition (Dochy, Segers, Vanden Bossche,
183 & Gijbels, 2003). Dochy and colleagues reviewed 43 empirical articles on problem-based learning in real-life
184 classroom settings.

185 These studies had a variety of assessment measures that could be categorized into factual knowledge and
186 application of knowledge, and included measures such as the NBME licensing test, modified essay questions, essay
187 questions, multiple choice, oral exams, performance-based testing, free recall, standardized patient simulation,
188 and cases. Thirty-three studies reported data on knowledge effect; while 25 studies reported data on application
189 of knowledge (numbers do not add up to 43 because several studies reported data on more than one category).
190 The authors found that PBL was better in allowing students to apply their knowledge (skill development), while
191 there were no differences on the factual knowledge.

192 1 Global (F) a) Problem-based Learning in Engineering 193 Education

194 One of the main aims of engineering education is "to produce broad-based, flexible graduates who can think
195 integratively, solve problems and be life-long learners" (Engineering Professors' Conference as stated in (Matthew
196 & Hughes, 1994), p. 234).

197 Given that engineers need more than just factual technical knowledge to be successful in an illstructured
198 and complex environment, problem-based learning seems well suited to prepare future engineers. Problem-based
199 learning in engineering is a natural fit since it espouses developing students' ability to solve illdefined problems,
200 increasing critical thinking skills, and broadening their communication skills (Johnson, 1999; Prince, 2004).
201 Additionally, PBL provides students with life-long learning skills that they can use to effectively and efficiently
202 acquire new skills and knowledge required in their career as engineers ??Woods, 1996). Some of the classes
203 in engineering curriculum, such as design and capstone courses, already incorporate (unintentionally) aspects of
204 problem-based learning (Johnson, 1999). Several authors have also reported explicitly implementing PBL in their
205 engineering courses; however, such use is still limited ??Mills & Treagust, 2003). In one study, Bizjak (2008)
206 described the incorporation of PBL in an electrical engineering graduate program in Slovenia. The authors found
207 that students gained more substantial knowledge than with traditional methods, as evidenced by higher test
208 scores. PBL also received positive feedback from students and faculty, who completed a survey questionnaire
209 Specifically, students reported that PBL allowed them to gain confidence in their problem-solving abilities,
210 prepared them for their future careers, and improved their interpersonal and collaborative skills. In another
211 electrical engineering example, de Camargo Ribiero (2008) conducted a qualitative study of student evaluation
212 of the PBL approach in a classroom at a university in Brazil. Students reported that the PBL approach was
213 more engaging and interesting as it allowed them to construct their own knowledge instead of absorbing teachers'
214 words and they were able to seek information on their own to solve problems. Students also reported that they
215 developed specific work skills such as, ability to research, produce syntheses, express ideas, communicate, and
216 effectively work in teams to develop solutions to problems.

217 These results suggest that PBL is an effective pedagogical tool to engage and increase students' interest
218 in problem solving as well as beneficial for their knowledge gains. There have also been some programmatic
219 implementations of problem-based learning.

220 For example, Polanco and colleagues (2004) conducted a three-year evaluation of a problem-based learning
221 integrated curriculum in a second-year engineering program at a Mexican university. The longitudinal data
222 suggested that students taught with PBL achieved significantly higher grades and performed better than students
223 who received traditional instruction in advanced engineering courses. Similarly, Woods (1996) examined the
224 influence of a PBL curriculum on students in a chemical engineering program at McMaster University in Canada.

225 The results suggested that PBL students had more positive course perceptions and scored higher on the written
226 three-hour exam as compared to the control group of engineering students. The author also found that PBL
227 students' confidence in problem-solving skills and their willingness to solve challenging problems also increased
228 substantially compared to traditional students, suggesting that PBL students' attitudes aligned with open-ended
229 problem solving and selfdirected learning.

230 Canavan (??2008) also examined problem-based learning applied to electronic and electrical engineering at

231 three universities in the United Kingdom. The results from the questionnaires and interviews suggested that
232 students preferred the PBL approach because it allowed them to engage in deep thinking skills and assume more
233 responsibility for their learning. The students also reported the PBL approach fostered more generic skills, such
234 as communication skills, group work, critically evaluating information, and time and task management, which
235 are crucial in "developing versatile and confident engineer of the future" (p. 179).

236 In spite of the recent use of more problem-based learning, research on the impact of these approaches on
237 students' conceptual understanding is The problem-based learning approach described in the study is based
238 upon the floating facilitator model and is similar to self-directed, interdependent, small group problem-based
239 learning (Prince & Felder, 2006; Woods, 1996). Within this PBL approach, students work in teams of 3-5
240 students with the instructor facilitating students' understanding of the material and students are responsible for
241 their own learning (Prince & Felder, 2006).

242 The problem-based learning approach used in this study is different from project-based learning. During
243 project-based learning students have gained the required knowledge base through formal instruction and central
244 focus is on the final product, whereas problem based learning typically requires students to work on illstructured
245 problems while acquiring necessary knowledge base to complete the task and focus is on the learning process
246 rather than final product (Prince & Felder, 2007).

247 In addition to assessing learning outcomes, researchers have tried to examine student perceptions of the PBL
248 approach and how they match with actual learning. Research from psychology has suggested that students'
249 judgments of learning are not accurate predictors of their actual learning outcomes (Dunlosky & Lipko, 2007;
250 Glenberg, Wilkinson, & Epstein, 1982).

251 As per Dr Khaled Zehry; Dr. Neel Halder Problem based learning (PBL) is a teaching strategy to promote
252 self-directed learning and critical thinking through problem solving. This educational approach has become a
253 distinct methodology and has been widely adopted within medical education as a method of teaching.

254 PBL as an effective learning method is still debatable. Several systematic reviews have investigated this
255 particular issue with no conclusive evidence 1. Although, the debate on measuring its effectiveness in disciplines
256 is unlikely to cease 2 and the concept of causal relationship to improvements has been questioned 3, more research
257 on PBL should be done to shed more light on its effectiveness over traditional teaching methods. It will also
258 be important to conduct more students' surveys on their views on PBL. A key to implement PBL successfully
259 is for tutors to understand the learning theories behind it and to be able to adapt efficiently to the facilitator
260 role rather than a traditional teaching Glenberg, Wilkinson, and Epstein found that students have an "illusion
261 of knowing" and tend to be overconfident in their understanding of the material. Given that the majority of
262 the research on problem-based learning has focused on student perceptions, it is important to examine whether
263 perceptions are an accurate predictor for learning. Hence, our purpose in this study was to examine the impact
264 of problem-based learning on students' learning and conceptual understanding. Specifically, this study addressed
265 the following research questions: To get a better handle on the problem, IIT Bombay undertook a study on the
266 engineering landscape in India.

267 The study aimed to answer questions such as: Has the engineering education system been able to provide,
268 quantitatively and qualitatively, the engineers required for the growth of the Indian economy?

269 Has it provided the research and development leadership required for our industry?

270 In the context of globalization, is there a need to modify the higher engineering education system in India?

271 The study shows that against the sanctioned seats of 6.57 lakh for Under Graduate Engineering education in
272 India, only 2.37 Lac engineering degrees were awarded in 2007-08. This very clearly highlights the shortfall.
273 In 2006, India awarded about 2.37 lakh engineering degrees, 20,000 engineering Masters Degrees and 1000
274 engineering PhDs, which means a total of 2.58 lakh engineering degrees of all types. This is clearly not enough!
275 The awarding of degrees is also not evenly distributed across India. Five states -Tamil Nadu, Andhra Pradesh,
276 Maharashtra, Karnataka and Kerala are said to account for almost 69% of the country's engineers. It is estimated
277 that about 30% of the fresh engineering graduates are unemployed even one year after graduation; and this is
278 even as many sectors complain of lack of talent. This clearly points that there is definite scope to improve
279 quality of engineering education. Let us also look at the gender factor. At IIT Bombay, the percentage of women
280 graduates to the total is about 8% at the B.Tech. level, 9% at the M.Tech level and about 17% at the Doctoral
281 level including Science, Humanities and among the faculty -only about 10% of the IIT Bombay faculty comprises
282 women. Gender disparity in the engineering stream exists around the world, not just in India, and special efforts
283 are being made by institutions, Governments and professional organizations to rectify these. Some Indian states
284 have provided incentives like free tuition for women studying engineering. Overall, the study rightly points out
285 that India has the potential to be a leading research and design hub in the world. For this, we need to have a
286 mechanism to identify important areas and develop policies and institutions accordingly.

287 2 Global (F)

288 Situations and problems we confront today demand composite responses and solutions.

3 b) New Kind of Engineer

289

290 Globalization has resulted in highly dynamic and complex market leading to the requirement of a new kind of
291 Engineer.

4 c) Systems Thinking

292

293 This complexity demands a new way of thinking -it requires a Systems Thinking approach to macro level challenges
294 and requires Engineers to keep one eye on the big picture even as they tackle specific tasks. Systems thinking
295 provides a conceptual framework that helps make full patterns clearer and helps one to see how to modify these
296 patterns more effectively.

297 This type of thinking is tricky to most of us because As Peter Senge says, it is a "discipline for seeing the
298 whole". We are taught to break problems apart, to fragment the world! This appears initially to make complex
299 tasks more manageable; but we pay a hidden price: we can no longer see the consequences of our actions,
300 and we lose our intrinsic sense of connection to a larger whole. When we want to see the big picture, we try
301 to reassemble the fragments and organize all the pieces. The task is futile-similar to trying to reassemble the
302 fragments of a broken mirror! d) Multi-Disciplinary Approach Today's Engineers must also be able to view
303 management activities through different lenses and work with people from different disciplines and diverse fields
304 such as business, banking services and medicine.

305 We also have great minds, great thinkers. We just have to look for ways to bring them together. It is this
306 fraternity of Engineers that will determine "INDIA OF TOMORROW".

307 We have travelled a very long journey and our "Intellect" is second to none. What we need is to mould young
308 professionals to the needs of our Industry. The eyes of the world are on us. We have the opportunity to become
309 a superpower. We all owe it to ourselves to shoulder the responsibility. "Yesterday's collaborators are today's
310 Competitors".

311 We will decide our role on the global stage. To meet this challenge we need engineers with "MULTI-
312 DISCIPLINARY APPROACH" e) Innovation-Led Growth India's future growth will be driven not by cost but
313 by innovation in terms of product offerings, process efficiency, value engineering and cost reduction.

5 f) Developmental Challenges

314

315 Even as we reach for the moon, there are millions here on earth for whom basic needs are elusive. No country
316 can afford a skewed growth. If India has to achieve a 7% to 8% sustained growth, it needs not just "Corporate
317 India" but the rural sector, the agricultural sector to grow as well. It is these areas that badly need the above
318 cited engineering talent. The government, we and all of us together have to find ways to produce the above brand
319 of Engineers motivated enough to make it an attractive option for them to take up these challenges.

320 However, today's engineering graduates lack these skills and have difficulty applying their fundamental
321 knowledge to problems of practice ??Mills & Treagust, 2003; ??AE, 2005; ??guyen, 1998; ??ergara, et al.,
322 2009).In addition, while science and engineering jobs experienced annual average growth rate of 6.7% (compared
323 to 1.6% for total employment) between1950-2000, the attrition rate for students has steadily increased and the
324 annual graduation rate decreased by 20%, ??Felder, Felder, & Dietz, 1998; ??SB, 2008). One of the complaints
325 from engineering students is that the current teaching pedagogies (such as, traditional lecture format) emphasize
326 explicit instruction, working individually, and norm-reference grading, which can make learning extrinsically
327 motivating rather than intrinsically motivating ??Felder, et al., 1998). The main problem within engineering
328 education is the gap between the active field and the passive classroom experience (Palmquist , 2007).

329 In general, the traditional lecture method within engineering education is deductive, "beginning with theories
330 and progressing towards application of those theories" and the instructor presents information without a
331 discussion of why the mathematical models are being developed and what practical problems they will solve
332 ??Prince & Felder, 2006). And not specific to the situation in which the task needs to take place. This
333 pedagogical approach falls short because the knowledge is not grounded. Dewey suggested that educators needed
334 to encourage inquiry and that education should be grounded on experience and linked to real-life activities in
335 order to motivate and develop students into upstanding citizens. The problem-based learning (PBL) has the
336 potential to help students to cope with the demands of complexities of the field and problems they will face in
337 their future careers.

338 Problem-based learning (PBL) is a better alternative to traditional classroom learning.

339 With PBL, the teacher provides a problem to the students, usually a small group. In this system, teacher does
340 not provide any kind of lectures, course contents, assignments or exercises.

341 The learning depends solely on the student's efforts, the sense he has to discover and work with content that is
342 necessary to solve the problem. Hence the learning becomes active A well designed problem provokes students to
343 encounter and struggle with the control concepts and a principle of discipline. These skills include presentation
344 and communication skills, self assessment and reflection skills, group participation and leadership skills. PBL is
345 generally done by small groups of students working together for a common goal. Finally the choice of the students
346 based upon various factors makes them take decisions that result in effective solutions and learning process in
347 general.

348 In PBL, the teacher acts as facilitator and mentor rather than a source of solutions. The teacher introduces
349 an "ill-structured" problem to a group of students.

350 The group discusses the problem statement and lists its significant parts.

351 The problem may appear as very tough for the group to solve but that is the real inspiration source to work
352 hard on it. The group has to work using their vision and technical skill to find solution.

353 ii. List the information already known to the group which can help the solution.

354 This includes both what each member of the group actually knows. Each information and idea of every group
355 member is important.

356 iii.

357 Develop, and write summary of, the problem statement in your own words.

358 Every person can understand the thing better in his own way expressions. Thus, a problem statement should
359 come from the group's analysis of what the group knows, and what the group will need to know to solve it.

360 **6 iv.**

361 List all possible solutions.

362 The problem is discussed in group. Various possible solutions may appear together, now to search which
363 solution is best, the group can list them all, then order them from strongest to weakest Now, they can choose
364 the one which appear them the best, or most likely to succeed.

365 **7 v.**

366 Prepare list of actions to be taken with a "time bound" Solution. Now, when the possible solution is decided, the
367 group should prepare a list of necessary actions to be taken to reach to the solution. All these actions must have
368 a time limit to avoid any kind of delay and all team members should work together or the work can be divided
369 also depending on the kind of actions needed.

370 vi. List information necessary to know.

371 Any information can be useful to fill in the missing gaps. Discuss possible sources like experts, books, web
372 sites, etc.

373 vii. Submit the possible solution with data.

374 Usually the group has to present their findings and/or recommendations to their classmates. In short, the"
375 process" and the "outcome".

376 viii. Presenting and defending your conclusions.

377 The group has found a good solution but to present it confidently and convincingly is more important than
378 any other thing. Otherwise all labor will go waste. The group should be preparing to state both the problem
379 and the conclusion clearly as well as summarize the process and difficulties encountered.

380 **8 b) Problem-solving Ability**

381 Another intended learning outcome of PBL is increased problem-solving ability. A problem exists when there
382 is a discrepancy between our expectation and what we get. Specifically, PBL is designed to increase students'
383 abilities to solve ill-structured problems (Gallagher et al., 1992). Ill-structured problems "have many alternative
384 solutions, vaguely defined or unclear goals and unstated constraints, and multiple criteria for evaluating solutions"
385 (Jonassen, p. 21). c) Self-Directed Learning Self-directed learning is "any increase in knowledge, skill,
386 accomplishment, or personal development that an individual selects and brings about by his or her own efforts
387 using any method in any circumstances at any time" (Gibbons, 2002, p. 2). PBL is specifically designed to
388 increase students' abilities to direct their own learning d) It is concluded that the impact of problem-based
389 learning (PBL) on undergraduate Electronics & Global (F) ^{1 2}

390 Communication engineering students' conceptual understanding and their perceptions of learning using PBL
391 as compared to traditional lecture is far better. Fifty students enrolled in an Electronics & Communication
392 course at a SRMGPC, Lucknow, participated in this research. Retention was found to be fantastic.
