Abstract

In this paper I presented a numerical technique for solving Kuramoto-Sivashinsky equation, based on spectral Fourier methods. This equation describes reaction diffusion problems, and the dynamics of viscous-fluid films flowing along walls. After we wrote the equation in Fourier space, we get a system. In this case, the exponential time differencing methods integrate the system much more accurately than other methods since the exponential time differencing methods assume in their derivation that the solution varies slowly in time. When evaluating the coefficients of the exponential time differencing and the exponential time differencing Runge Kutta methods via the Cauchy integral. All computational work is done with Matlab package.

1 Introduction

Fourier analysis occurs in the modeling of timedependent phenomena that are exactly or approximately periodic. Examples of this include the digital processing of information such as speech; the analysis of natural phenomena such as earthquakes; in the study of vibrations of spherical, circular or rectangular structures; and in the processing of images. In a typical case, Fourier spectral methods write the solution to the partial differential equation as its Fourier series. Fourier series decomposes a periodic realvalued function of real argument into a sum of simple oscillating trigonometric functions (sine and cosine), that can be recombined to obtain the original function. Substituting this series into the partial differential equation gives a system of ordinary differential equations for the time-dependent coefficients of the trigonometric terms in the series then we choose a timestepping method to solve those ordinary differential equations II.

2 Fourier Series

The Fourier series of a smooth and periodic real-valued function $f(x)$ on $[0; 2\pi]$ with period 2π is L^2 norm $\|f\|_{L^2} = \left(\int_0^{2\pi} |f(x)|^2 dx \right)^{1/2}$ $\sin(x)$ $\cos(x)$ The FFT algorithm reduces the computational work required to carry out a discrete Fourier transform by reducing the number of multiplications and additions of (13), computational time is reduced from $O(N^2)$ to $O(N \log N)$.

To apply spectral methods to a partial differential equation we need to evaluate derivatives of functions. Suppose that we have a periodic real-valued function $f(x)$ on $[0; 2\pi]$ with period 2π that is discretized on an even number N of grid points, so that the grid size $\Delta x = 2\pi/N$. The complex form of the Fourier series representation of $f(x)$ is $f(x) = \sum_{k=-N/2}^{N/2-1} c_k e^{ikx}$, where $c_k = \frac{1}{N} \int_0^{2\pi} f(x) e^{-ikx} dx$. At $x_j = j\Delta x$, the above series gives a term $f_j = \sum_{k=-N/2}^{N/2-1} c_k e^{ijk\Delta x}$, and since it cannot be differentiated, we should set its derivative to be zero at the grid points. The numerical derivatives of the function $f(x)$ can be illustrated as a matrix multiplication. For the first derivative, we multiply the Fourier coefficients (11) by the corresponding differentiation matrix for an even number N of grid points. $D_{jk} = \frac{1}{\Delta x} \delta_{j,k} - \frac{i}{2} (\delta_{j,k+1} + \delta_{j,k-1})$

This matrix has non-zero elements only on the diagonal. For an odd number N of grid points the differentiation matrix corresponding to the first derivative is diagonal with elements.

$D_{jj} = i(-1)^j \cot(\pi/(2N))$

Then, we compute an inverse discrete Fourier transform using (11) to return to the physical space and deduce the first derivative of $f(x)$ on the grid. Similarly, taking the second derivative corresponds to the multiplication of the Fourier coefficients (11) by the corresponding differentiation matrix for an even number N of grid points. $D_{jk} = -\frac{k^2}{N^2} \delta_{j,k}$

In general, in case of an even number N of grid points approximating the m -th numerical derivatives of a grid function $f(x)$ corresponds to the multiplication of the Fourier coefficients (11) by the corresponding differentiation matrix which is diagonal with elements $D_{jk} = (-i k)^m \delta_{j,k}$ for $0, 1, 2, 3, \dots, 1, -1, \dots, -(N/2 - 1)$ with the exception that for odd derivatives we set the derivative of the highest mode

The family of exponential time differencing schemes. This class of schemes is especially suited to semi-linear problems which can be split into a linear part which contains the stiffest part of the dynamics of the problem, and a nonlinear part, which varies more slowly than the linear part. Exponential time differencing schemes are time integration methods that can be efficiently combined with spatial approximations to provide accurate smooth solutions for stiff or highly oscillatory semi-linear partial differential equations. In this paper I will present the derivation of the explicit Exponential time differencing schemes for arbitrary order following the approach in [1] [2] [3] to obtain. [4] [5] [6] [7] [8] [9] [10] [11] [12] [13] [14] [15] [16] [17] [18] [19] [20] [21] [22] [23] [24] [25] [26] [27] [28] [29] [30] [31] [32] [33] [34] [35] [36] [37] [38] [39] [40] [41] [42] [43] [44] [45] [46] [47] [48] [49] [50] [51] [52] [53] [54] [55] [56] [57] [58] [59] [60] [61] [62] [63] [64] [65] [66] [67] [68] [69] [70] [71] [72] [73] [74] [75] [76] [77] [78] [79] [80] [81] [82] [83] [84] [85] [86] [87] [88] [89] [90] [91] [92] [93] [94] [95] [96] [97] [98] [99] [100] [101] [102] [103] [104] [105] [106] [107] [108] [109] [110] [111] [112] [113] [114] [115] [116] [117] [118] [119] [120] [121] [122] [123] [124] [125] [126] [127] [128] [129] [130] [131] [132] [133] [134] [135] [136] [137] [138] [139] [140] [141] [142] [143] [144] [145] [146] [147] [148] [149] [150] [151] [152] [153] [154] [155] [156] [157] [158] [159] [160] [161] [162] [163] [164] [165] [166] [167] [168] [169] [170] [171] [172] [173] [174] [175] [176] [177] [178] [179] [180] [181] [182] [183] [184] [185] [186] [187] [188] [189] [190] [191] [192] [193] [194] [195] [196] [197] [198] [199] [200] [201] [202] [203] [204] [205] [206] [207] [208] [209] [210] [211] [212] [213] [214] [215] [216] [217] [218] [219] [220] [221] [222] [223] [224] [225] [226] [227] [228] [229] [230] [231] [232] [233] [234] [235] [236] [237] [238] [239] [240] [241] [242] [243] [244] [245] [246] [247] [248] [249] [250] [251] [252] [253] [254] [255] [256] [257] [258] [259] [260] [261] [262] [263] [264] [265] [266] [267] [268] [269] [270] [271] [272] [273] [274] [275] [276] [277] [278] [279] [280] [281] [282] [283] [284] [285] [286] [287] [288] [289] [290] [291] [292] [293] [294] [295] [296] [297] [298] [299] [300] [301] [302] [303] [304] [305] [306] [307] [308] [309] [310] [311] [312] [313] [314] [315] [316] [317] [318] [319] [320] [321] [322] [323] [324] [325] [326] [327] [328] [329] [330] [331] [332] [333] [334] [335] [336] [337] [338] [339] [340] [341] [342] [343] [344] [345] [346] [347] [348] [349] [350] [351] [352] [353] [354] [355] [356] [357] [358] [359] [360] [361] [362] [363] [364] [365] [366] [367] [368] [369] [370] [371] [372] [373] [374] [375] [376] [377] [378] [379] [380] [381] [382] [383] [384] [385] [386] [387] [388] [389] [390] [391] [392] [393] [394] [395] [396] [397] [398] [399] [400] [401] [402] [403] [404] [405] [406] [407] [408] [409] [410] [411] [412] [413] [414] [415] [416] [417] [418] [419] [420] [421] [422] [423] [424] [425] [426] [427] [428] [429] [430] [431] [432] [433] [434] [435] [436] [437] [438] [439] [440] [441] [442] [443] [444] [445] [446] [447] [448] [449] [450] [451] [452] [453] [454] [455] [456] [457] [458] [459] [460] [461] [462] [463] [464] [465] [466] [467] [468] [469] [470] [471] [472] [473] [474] [475] [476] [477] [478] [479] [480] [481] [482] [483] [484] [485] [486] [487] [488] [489] [490] [491] [492] [493] [494] [495] [496] [497] [498] [499] [500] [501] [502] [503] [504] [505] [506] [507] [508] [509] [510] [511] [512] [513] [514] [515] [516] [517] [518] [519] [520] [521] [522] [523] [524] [525] [526] [527] [528] [529] [530] [531] [532] [533] [534] [535] [536] [537] [538] [539] [540] [541] [542] [543] [544] [545] [546] [547] [548] [549] [550] [551] [552] [553] [554] [555] [556] [557] [558] [559] [560] [561] [562] [563] [564] [565] [566] [567] [568] [569] [570] [571] [572] [573] [574] [575] [576] [577] [578] [579] [580] [581] [582] [583] [584] [585] [586] [587] [588] [589] [590] [591] [592] [593] [594] [595] [596] [597] [598] [599] [600] [601] [602] [603] [604] [605] [606] [607] [608] [609] [610] [611] [612] [613] [614] [615] [616] [617] [618] [619] [620] [621] [622] [623] [624] [625] [626] [627] [628] [629] [630] [631] [632] [633] [634] [635] [636] [637] [638] [639] [640] [641] [642] [643] [644] [645] [646] [647] [648] [649] [650] [651] [652] [653] [654] [655] [656] [657] [658] [659] [660] [661] [662] [663] [664] [665] [666] [667] [668] [669] [670] [671] [672] [673] [674] [675] [676] [677] [678] [679] [680] [681] [682] [683] [684] [685] [686] [687] [688] [689] [690] [691] [692] [693] [694] [695] [696] [697] [698] [699] [700] [701] [702] [703] [704] [705] [706] [707] [708] [709] [710] [711] [712] [713] [714] [715] [716] [717] [718] [719] [720] [721] [722] [723] [724] [725] [726] [727] [728] [729] [730] [731] [732] [733] [734] [735] [736] [737] [738] [739] [740] [741] [742] [743] [744] [745] [746] [747] [748] [749] [750] [751] [752] [753] [754] [755] [756] [757] [758] [759] [760] [761] [762] [763] [764] [765] [766] [767] [768] [769] [770] [771] [772] [773] [774] [775] [776] [777] [778] [779] [780] [781] [782] [783] [784] [785] [786] [787] [788] [789] [790] [791] [792] [793] [794] [795] [796] [797] [798] [799] [800] [801] [802] [803] [804] [805] [806] [807] [808] [809] [810] [811] [812] [813] [814] [815] [816] [817]

9 The Kuramoto-Sivashinsky Equation

The Kuramoto-Sivashinsky equation, is one of the simplest PDEs capable of describing complex behavior in both time and space. This equation has been of mathematical interest because of its rich dynamical properties. In physical terms, this equation describes reaction diffusion problems, and the dynamics of viscous fluid films flowing along walls.

Kuramoto-Sivashinsky equation in one space dimension can be written as

$$u_t + u u_x + u_{xxxx} = -u^2 \quad (14)$$

Equation (14) can be written in integral form if we introduce $u(x, t) = \sum_{k=-\infty}^{\infty} \hat{u}_k(t) e^{ikx}$, then

$$\frac{d\hat{u}_k}{dt} + \frac{1}{2}(\hat{u}_k \hat{u}_{-k}) + \frac{1}{2}(\hat{u}_k \hat{u}_{-k}) = -\frac{1}{2}(\hat{u}_k \hat{u}_{-k}) \quad (15)$$

The Kuramoto-Sivashinsky equation with periodic boundary conditions in Fourier space can be written as follows

$$\frac{d\hat{u}_k}{dt} + \frac{1}{2}(\hat{u}_k \hat{u}_{-k}) + \frac{1}{2}(\hat{u}_k \hat{u}_{-k}) = -\frac{1}{2}(\hat{u}_k \hat{u}_{-k}) \quad (16)$$

In final form will be

$$\frac{d\hat{u}_k}{dt} + \frac{1}{2}(\hat{u}_k \hat{u}_{-k}) + \frac{1}{2}(\hat{u}_k \hat{u}_{-k}) = -\frac{1}{2}(\hat{u}_k \hat{u}_{-k}) \quad (18)$$

Equation has strong dissipative dynamics, which arise from the fourth order dissipation. The stiffness in the system (17) is due to the fact that the diagonal linear operator

, with the elements, has some large negative real eigenvalues that represent decay, because of the strong dissipation, on a time scale much shorter than that typical of the nonlinear term. The nature of the solutions to the Kuramoto-Sivashinsky equation varies with the system size of linear operator. For large size of linear operator, enough unstable Fourier modes exist to make the system chaotic. For small size of linear operator, insufficient Fourier modes exist, causing the system to approach a steady state solution. In this case, the exponential time differencing methods integrate the system very much more accurately than other methods since the exponential time differencing methods assume in their derivation that the solution varies slowly in time.

VI.

10 Numerical Result

For the simulation tests, we choose two periodic initial conditions

$$u(x, 0) = 2 \cos(x) \quad \text{and} \quad u(x, 0) = \cos(6.02 \sin(1.02 \cos(7.1)))$$

When evaluating the coefficients of the exponential time differencing and the exponential time differencing Runge Kutta methods via the "Cauchy integral" approach, the solution appears more clear as a mesh plot and shows waves propagating, traveling periodically in time and persisting without change of shape.

11 VII.

12 Conclusions

In this paper, the main objective of this study was for finding the solution of one dimensional semilinear fourth order hyperbolic Kuramoto-Sivashinsky equation, describing reaction diffusion problems, and the dynamics of viscous-fluid films flowing along walls. In order to achieve this, we applied Fourier spectral approximation for the spatial discretization. In addition, we evaluated the coefficients of the exponential time differencing and the exponential time differencing -fourth order Runge Kutta methods via the "Cauchy integral". Some typical examples have been demonstrated in order to illustrate the efficiency and accuracy of the exponential time differencing methods technique in this case. For the simulation tests, we chose periodic boundary conditions and applied Fourier spectral approximation for the spatial discretization. In addition, we evaluated the coefficients of the Exponential Time Differencing Runge-Kutta methods via the "Cauchy integral" approach. The equations can be used repeatedly with necessary adaptations of the initial conditions.
