

Social-Economic Effects and Political Satisfaction from Pedestrian Footbridges in Rural Areas

Leopold Mbereyaho

Received: 9 December 2020 Accepted: 1 January 2021 Published: 15 January 2021

Abstract

It is generally accepted that having a proper river crossing point has a positive effect on rural inhabitants. Such crossing points would increase the ability of communities to access their social services, markets, jobs, and thereby lead to raising their standard of living. In line with this objective, Rwanda has been promoting the construction of pedestrian footbridges in rural areas, and with different partners, different pedestrian footbridges have already been constructed. It is very crucial that all institutions involved in the construction of pedestrian footbridges, both public and private, consider the financial benefits of pedestrian footbridges and some significant direct and indirect effects on the rural communities. The Objective of this study was to identify all possible benefits that may be generated by pedestrian footbridges to understand the potential range of their impacts in rural areas and the likely responses from those people impacted by the project. The study also proposed a comprehensive approach for estimating the economic impacts of a pedestrian footbridge in rural areas. The methodology involved community interviews conducted during site visits to identify and predict possible impacts due to the lack and availability of safe access via pedestrian footbridges.

Index terms— political satisfaction, pedestrian footbridge, bridges to prosperity, social-economic effects.

1 I. Introduction

dequate access to social-economic facilities and services, as hospitals, schools, and shopping centers, etc., for many people living in rural areas, has been one of development goals in developing countries. One of the most affordable and viable alternatives means against rural isolation is the construction of pedestrian footbridges. The protection of people as they go about their everyday lives in their neighborhoods or workplaces may be influenced by improvement in transportation systems [1].

A pedestrian-friendly environment can be transformed by unsafe river crossing points or changes in traffic habits that place residents at higher risk of injury or death. Such changes need consideration of adequate and safe crossing points for pedestrians, animals, bicycles, and motorcycles.

As a developing country, Rwanda is committed to addressing the problem of inadequate pedestrian footbridges in rural areas, resulting from its geographical conditions. In partnership with districts and other public and private institutions, an International Non-Governmental Organization, Bridges to Prosperity (B2P), which is specialized in the design and construction of pedestrian footbridges, has been constructing pedestrian footbridges for the past nine years. B2P's contribution has resulted in 95 bridges implemented in different districts of Rwanda to serve over 400,000 people. Per an agreement with the Government of Rwanda, over 100 more are to be completed over the next three years [2].

Although the immediate impacts of Pedestrian footbridges in rural areas, such as transport costs, travel time, and improved safety, are clear, there are long-term impacts such as increased profitability of farmers and business revenue change, as well as increased employment in the agricultural and non-agricultural sectors. It should be also emphasized that the development of rural infrastructure, whether physical or nonphysical, not only improves local economic capacity, but also plays a direct and indirect role in reducing poverty [3].

44 It is necessary that all institutions involved in the construction of pedestrian footbridges, both public and
45 private, are well aware of the value and benefits of the pedestrian footbridges to rural communities which may
46 have significant indirect effects on rural communities, which could result from the direct effects. It is clear
47 that while a pedestrian footbridge can allow the crossing of respective obstacles by communities, it boosts their
48 economy and the national economy in general. As a result, it directly affects the political trust of the communities
49 and the development of the country. Therefore, a comprehensive approach for estimating the social-economic
50 effects of a pedestrian footbridge in rural areas is indispensable to understand the importance of investment in
51 rural pedestrian infrastructure.

52 The aim of social-economic impact assessment is to enable the government and other key stakeholders to
53 recognize and better predict the potential socioeconomic impacts from proposed projects, strategies, and services
54 for human populations and communities [4].

55 Some researchers have conducted studies on how pedestrian footbridges can improve rural economies. [5]
56 concluded that the construction of new pedestrian footbridge crossings links rural and underserved communities
57 in developing countries worldwide with the services they need. Some potential indirect effects, such as general
58 economic conditions of an area or region, the availability of municipal services, like sewer and water, the tax
59 incremental, and the quality of life, could occur beyond the project's actual right of way [6].

60 Pedestrian footbridges have a demonstrated impact well beyond the two communities they connect. A study
61 of the total geographic area served by one single pedestrian footbridge in Rwanda resulted in an average of 33
62 unique villages covering 47 square kilometers of mountainous terrain when considering the reported origins and
63 destinations. An average catchment area of 17 villages was then estimated with the adjustment to reflect only
64 journeys in service of livelihoods, health, and education [7]. A study about the methods to identify pedestrian
65 footbridge needs in rural areas of Liberia and Rwanda recommended a mixed approach that combines both
66 sophisticated remote methods with streamlined field-based methods that consider the existing local knowledge
67 and expertise and cataloged the extensive need for safe access throughout rural areas, as well as the destinations
68 that deemed critical by communities, but difficult to reach due to seasonally impassible rivers [8].

69 The possibility of creating a sustainable national Pedestrian footbridge program with the support of a
70 comprehensive Pedestrian footbridge management system was documented in 2020 by Claude Munyaneza. and
71 Leopold Mbereyaho. Analysis of condition data, determination of the ranking and priority of bridge maintenance
72 activities, as well as evaluation of the alternatives of preservation or replacement create an environment where
73 Pedestrian footbridges may be effectively built and maintained [9].

74 In 2020, Brooks and Donovan published their findings of a study about the impact of new bridges in
75 rural Nicaragua, which found that lack of reliable outside market access can have a significant effect on rural
76 economies' long-term agricultural decisions, and infrastructure benefits go beyond the ability to move products
77 more efficiently through space. Pedestrian footbridges improve accessibility to labor markets, which may decrease
78 distortions in the agricultural sector [10]. Such access to local businesses increases the safety within the community
79 and generally enhances the quality of life for residents [11]. This results in both social capitals as well as economic
80 fairness evaluations which have significant effects on political trust [12].

81 The Objective of this study was to identify all possible benefits resulting from pedestrian footbridge
82 construction to understand the range of potential impacts of a new pedestrian footbridge in rural areas and
83 the likely responses of those impacted by the projects, to highlight rural pedestrian and motorcycle transport as
84 an effective strategy for rural economic development.

85 The study also proposed a comprehensive approach for estimating the economic impacts of a pedestrian
86 footbridge in rural areas.

87 2 II. Methods

88 3 a) Methodology Description

89 In addition to the literature review, which provided an opportunity to understand the situation globally and
90 locally and note the gaps, the methodology used in this study involved community interviews and feedback
91 analysis. Interviews and discussions with 980 people, including 30 local leaders, ten bridge builders from B2P,
92 and 940 local communities who are mostly the beneficiaries of constructed pedestrian footbridges in different
93 districts, were held to understand and determine how they are impacted by the pedestrian footbridges. The
94 questionnaire was structured so that information concerning changes of lives before and after the construction
95 of pedestrian footbridge as well as expectations before the project were acquired. Observations made during
96 the site visits helped to identify or predict the impacts of blocked access, and safe crossings. Microsoft Excel
97 analysis tools developed the estimating approach of pedestrian footbridge benefits for rural communities with
98 established formulas. During the site visit, five pedestrian footbridges under the operation stage were selected.
99 The analysis involved the social and economic effects. Social effects were analyzed into four main categories such
100 as accessibility and connectivity, health and safety, an increase of income and reduction of cost, and cultural
101 well-being. The economic effects were analyzed in two main categories: economic impact from user cost and the
102 overall economic benefits.

103 Using statistical analysis software of Rao soft, five pedestrian footbridges were all assessed for their social-
104 economic and political satisfaction effects. Finally, one bridge was taken as a case study for the economic impact

105 assessment. identification and prediction of effects without the pedestrian footbridge and with the pedestrian
106 footbridge in the area. This study focused on identifying socioeconomic impact during the operation stage of a
107 pedestrian footbridge, to gain an understanding before and following pedestrian footbridges construction.

108 **4 c) Community Interest**

109 The community interest for this study has been informed by several sources. Several interested people were
110 selected because they identified as directly benefiting from the constructed bridges. Additionally, most used
111 the bridges to access their daily socioeconomic activities. For analyzing the effects of the project during the
112 construction stage, the communities who participated in all construction stages were also considered.

113 The community of interest was further informed by a demographic analysis of a wider geographic study area,
114 identifying social and community infrastructure and facilities within the study area, particularly those close to
115 the bridge. The demographic study area was selected to analyze the characteristics of residents and communities
116 within the catchment who were most likely to experience effects as a result of the bridge and assist in the
117 identification of potential community groups that may have been affected by the bridge project, particularly
118 those which are not in direct proximity to the bridge project.

119 Input from the wider community of interest was then sought through further engagement with identified
120 community groups and the general public. This included feedback provided by face-to-face interviews and open
121 day discussions and feedback.

122 **5 d) Social-Economic Impact Assessment Criteria**

123 Referring to the relevant categories of the International Association for Impact Assessment (IAIA) framework
124 [13], the following framework has been established for assessing the potential impacts that may result from a
125 Pedestrian footbridge project:

126 **6 Way of Life:**

- 127 ? Impacts on accessibility, connectivity, living habits, and mobility
- 128 ? Changes to ways of crossing (walking and cycling) Well, Being:
- 129 ? Changes to wellbeing ? Health and safety Financial:
- 130 ? Change of market price ? Benefit increase from agriculture productivity ? Making Money

131 **7 e) Rating of Effects**

132 In assessing effects, each effect has been given an overall rating of impacts. A four-point scale has been applied,
133 and the ratings applied are: ? Significant positive ? Moderate positive ? Minor positive ? Insignificant

134 In applying the overall rating of the effects, consideration was given to: the project stage of the effect
135 (construction, operational, or both), who is affected (directly affected, neighbors, wider community), the
136 probability of occurrence (high, medium, or low), and the magnitude of the impact (high, medium, low), and the
137 significance of the affected feature (local, regional, national) [14].

138 **8 III. Results**

139 **9 a) Results from the Interview i. Demographic Profile of Respondents**

140 As mentioned in section 2, the total number of participants for this study was 980 people, including 30 local
141 leaders, ten bridge builders from B2P, and 940 local communities. They are mostly the beneficiaries of the
142 constructed pedestrian footbridge in the area. Their demographic profile was considered into three main
143 categories, as summarized in Table 1 below. These include the age distribution, gender composition, and primary
144 occupation. ii.

146 **10 Social-Economic Effects of Pedestrian Foot bridges In Rural Areas**

147 As mentioned in section 2, five pedestrian footbridges built by Bridges to Prosperity were selected for the
148 assessment. Table 1 summarizes the overall main findings from the interviews, discussions with different
149 surrounding communities, and the observations made during site visits of those five pedestrian footbridges.
150 The table summarizes the effect and overall rating (the magnitude of the effect), the percentage of similarity
151 feedback, and further comments that were considered for assigning each effect with its rating.

153 **11 b) Economic Impact Analysis of Pedestrian Footbridge**

154 Cost categories of the economic impact of the pedestrian footbridge are summarized in Figure 1. As shown by the
155 figure, the economic impact was quantified using user cost for motorcycles and bicycles, user cost for pedestrians,

13 C) ESTIMATION OF ECONOMIC BENEFIT PER YEAR PER PEDESTRIAN FOOTBRIDGE FOR GASHYUSHYA SUSPENSION BRIDGE CASE STUDY I. GASHYUSHYA TRAIL BRIDGE PROFILE

156 economic benefit, and business revenue change. The scope of analysis presented in this study is limited to the
157 duration of one year.

158 12 i. Economic Impact from user Cost

159 As shown in Figure 1, the economic impact from User Cost is evaluated from Bicycle/Motorcycle user
160 cost and pedestrian user cost. They include motorcyclist/bicyclist, passenger, and pedestrians' costs. The
161 Motorcyclist/Bicyclist cost is comprised of the travel cost (fuel cost, etc.), the delay cost (the Amount of profit
162 that a motorcyclist or bicyclist loses when they are late to get to their destination), and the Operating cost (Tire or
163 tube replacement, general mechanical repair, etc.). The passenger cost comprises of the delay cost (the Amount
164 of profit that a passenger loses when they are late to get to their destination) and the travel cost (transport
165 charges, etc.). The Pedestrian cost comprises of the delay cost (the Amount of profit that a pedestrian loses
166 when they are late to get to their destination). Equations developed by [15] have been considered, modified,
167 and from there, the following equations 1 to 12 were developed.

168 Where 'WT CAP ' is the walking time by crossing the alternate crossing point (the nearest other safe crossing
169 point); 'WT CB ' is the walking time by crossing the bridge; 'ADTp' is average daily pedestrian traffic; 'IDY P '
170 is the impassable days per year for pedestrians (when the river is flooded and not impassable), and 'HR P '
171 hourly rate for pedestrians.

172 Motorcycle passenger delay Cost:
$$C_{mpd} = [(ADT_p \cdot WT_{CB} \cdot IDY_p \cdot HR_p) \cdot C_{mpd}] \cdot C_{mpd} \cdot C_{mpd} \cdot C_{mpd}$$

173
$$C_{mpd} = [ADT_p \cdot WT_{CB} \cdot IDY_p \cdot HR_p] \cdot C_{mpd} \cdot C_{mpd} \cdot C_{mpd} \cdot C_{mpd}$$
 (8)

174 Bicycle Passenger Travel Cost: ii. Business Revenue Change The formulas for business revenue changes
175 resulting from the construction of a new Pedestrian footbridge were developed using the theory created by [14].
176 The business revenue change when the community gets a safe crossing point is a component of economic impact
177 on surrounding businesses. The business revenue increase (BRC) is directly affected by the increase in customer
178 number (IC). It is also a function of average expenditure per household (AE). The number of weeks per year
179 that could be impossible to cross the river without a bridge when it is flooded (IW) means impassable weeks per
180 year.
$$BRC = [(IC \cdot AE \cdot (1 - IW))] \cdot C_{brc} \cdot C_{brc} \cdot C_{brc} \cdot C_{brc}$$

181
$$BRC = IC \cdot AE \cdot (1 - IW) \cdot C_{brc} \cdot C_{brc} \cdot C_{brc} \cdot C_{brc}$$
 (9)

182 A significant parameter in the quantification of revenue change of a Pedestrian footbridge is the influence area.
183 In this study, the bridge influence area was estimated based on the study conducted by Bridges to Prosperity, as
184 denoted in section 1 above, which was resulted in an average of 17 villages directly served by a single Pedestrian
185 footbridge.

186 The increase in a number of customers, as shown in Eq. 17, is a function of number of households that would
187 not be able to cross without the bridge when the river is flooded (HCWB) and the percentage area influenced by
188 the bridge (I), and the average frequency per week of patronizing businesses in area (F).
$$C_{brc} = HCWB \cdot I \cdot F \cdot C_{brc}$$

189
$$C_{brc} = HCWB \cdot I \cdot F$$
 (12)

190 I and F are estimated using survey data or just by estimating.

191 13 c) Estimation of Economic Benefit Per Year Per Pedestrian 192 Footbridge for Gashyushya Suspension Bridge Case Study i. 193 Gashyushya Trail Bridge Profile

194 The Gashyushya pedestrian footbridge is a suspension bridge built in 2019 by a non-Government organization,
195 Bridges to Prosperity, in collaboration with the Muhanga district. The communities surrounding the Gashyushya
196 pedestrian footbridge are primarily occupied by Agriculture of different crops mainly, potatoes and bananas. For
197 accessing their market, they must cross the Makurungwe River. Community members also have to cross the river
198 to access their social-economic facilities like schools, medical care, and jobs.

199 During the rainy season, the Makurungwe river frequently becomes violent and stays flooded and fast for three
200 days at a time. So, before the construction of the Gashyushya pedestrian footbridge, it was too dangerous to
201 cross during such period, which resulted in innumerable missed opportunities and has caused multiple injuries in
202 attempted crossings and in at least one reported death per year. The Gashyushya pedestrian footbridge provides
203 safe, year-round access for over 3,000 members of the Murama, Munini, and surrounding communities, providing
204 enhanced access to opportunity to empower the communities out of poverty. 2 and 3 summarize the results of the
205 economic impact from the Gashyushya Suspension Bridge constructed in Muhanga District in terms of user cost.
206 Most of the data were estimated from the participants' feedback during the interview and discussion, in addition
207 to the observations made during the site visit. The average daily traffic for pedestrians (ADT P), the average
208 daily traffic for motorcycles (ADT M), and the average daily traffic for bicycles (ADT B) were estimated from
209 the traffic count survey during seven days. iii. Economic Benefit The approach used by Rotary International for
210 analyzing the economic benefit for their funded projects was used in this study. It is composed of three main types
211 of benefits, which are the economic benefit from farming goods, the additional economic benefit for products and
212 farming goods, and the economic benefit from additional worker jobs. Table 4 summarizes the results from the
213 Gashyushya Suspension Bridge analysis. The estimated values were from the discussion with local communities
214 and the observations during site visits. As said earlier in this section, the business revenue changes when a

community receives a safe crossing point is a component of economic impact on surrounding businesses. The business revenue increase (BRC) is directly affected by the increase in customer number (IC). It is also a function of average expenditure per household (AE). The number of weeks per year that could be impossible to cross the river without a bridge when it is flooded (IW) means impassable weeks per year. Table 5 below summarize the results from the interviews and observations during the site visit of the Gashyushya suspension bridge. The total economic benefit from a constructed pedestrian footbridge is the summation of benefit from bridge user cost, farming goods, increase of employment, and the business revenue change. In Rural Areas Out of the total population interviewed, 96% showed that having a pedestrian footbridge in their rural areas gave them great pleasure and much confidence and appreciation of their leaders. Pedestrian footbridge increased the benefit from gross domestic products, which changed the economic situation in rural areas. Pedestrian footbridges increased the economic prosperity of a rural communities. Pedestrian footbridge in the traditional footpaths helps rural communities not only to access the social-economic facilities but also motivate and increase community hope and efforts, which affect the trustworthiness of the government to prioritize the population.

14 f) Discussion

15 i. Results Validation

The results from interviews and discussion are presented in Table 1. About 90% of participants were pedestrian footbridge beneficiaries in one way or another. These included the bridge users who cross it regularly to access their social-economic facilities, as well as others whose lives improved as a result of the overall economic benefit and business revenue change due to the pedestrian footbridges in their areas. There are some others who made and who are making money from the construction and use of pedestrian footbridge in their rural areas, where we can say for example the motorcyclists and cyclists.

The formulas to estimate the economic benefit year per pedestrian footbridge were developed from international theories for estimating the economic benefit for infrastructure projects. It was based on the existing factors that influence the economic growth in rural areas. The price of each factor was estimated from the information given by the local communities surrounding the pedestrian footbridge in the study.

ii. Discussion of the Results Social-Economic Effects of Pedestrian footbridge in Rural Areas: 1) More than 97% of respondents confirmed that pedestrian footbridges in their rural areas were effectively changing their livelihoods both socially and financially [5]. This is understandable because pedestrian footbridge improves their accessibility to social-economic facilities like schools, markets, health centers, etc. During the rainy season, the river was impassable, and many activities were stopped until the water lowered. 2) What was also found is that pedestrian footbridge is not only beneficial to the surrounding communities but also to the wider communities [7]. During the site visit on market day, some communities attending the market indicated that people traveled from 10 -15 kilometers away (two to three hours walking). This is mainly caused by the small number of social-economic facilities presented in some rural areas.

16 3) Gashyushya Suspension Bridge built by Bridges to

Prosperity was taken as a case study to analyze the economic benefit per year. The total benefit resulting from bridge user cost represented about 39.22% of the total benefit of the bridge per annual. The Benefit from the farming goods and products in addition to the benefit from additional work jobs takes about 45.53 %, while the benefit from the business revenue changes represents about 15.25 %. 4) It has been found that in some areas, communities do not benefit from the constructed pedestrian footbridge due to the small number of bridges presented in the area, because there are need for pedestrian footbridges, but they are not known.

There should be a better way to identify all needed pedestrian footbridges in rural areas [8]. Otherwise, some communities are having difficulties to cross a water point before they access the constructed Pedestrian footbridge.

17 Political Satisfaction Effects of Pedestrian footbridge in

Rural Areas: 1) Pedestrian footbridge increased the government trustworthiness of the communities around the constructed pedestrian footbridge in rural areas. This is very understandable because one of the indicators of the political satisfaction of the population are the social and cultural coherence and economic growth, which are directly affected by infrastructure development 2) Pedestrian footbridges helped the communities not only to access their social-economic facilities but also to fulfill their needs and desire and increased the benefit from gross domestic products, which increased the economic prosperity in their rural areas.

18 IV. Conclusion

The main objective of this study was to identify potential benefits and propose the comprehensive approach of estimating the economic benefits of a pedestrian footbridge in rural areas to better understand the potential impacts of the constructed pedestrian footbridges in rural areas and the likely responses of those impacted by the projects. With the detailed literature review, interviews, and discussion with different foot bridging stakeholders, the following results were achieved:

18 IV. CONCLUSION

272 1. As per the majority of participants in this study, a pedestrian footbridge in rural areas have a significant
273 social-economic effect which are directly affect the political satisfaction of local communities in rural areas. 2.
274 Different formulas were developed, and one bridge was selected as a case study to analyze its economic benefit
275 to the surrounding community. The total benefit resulted from the user cost, farming goods, and products, and
276 benefit from the business revenue was estimated as One hundred and fortysix million and nine hundred and
277 sixty-nine thousand Rwandan Francs (146,969,000 Rwf) per year. This number is a good example and proof of
278 investment needs in the pedestrian footbridges, which affect not only the rural community but also the country's
279 economy in general. 3. The present detailed bridge social-economic effects, which are conducted by Bridges to
280 Prosperity before and after the bridge is built, could help to understand how communities are being impacted by
281 pedestrian footbridges in rural areas. 4. All Pedestrian footbridge effects outlined in this study were adequate
282 and comprehensive enough to support relevant authorities to prioritize the pedestrian footbridges wherever they
283 are needed in the country.

284 Based on the above results, it is recommended that pedestrian footbridges could be prioritized not only to
285 provide access to the rural communities but also to facilitate their economic growth to break the cycle of poverty.
286 A further study would be welcome for a comparative investigation between the total cost of a new pedestrian
287 footbridge with the total economic benefit of a pedestrian footbridge during its entire life span, to understand
well how the investment in pedestrian footbridge can contribute to the entire economic growth of a country.

The bridges increased the economic revenue, which gave the communities the ability to pay their "mutuel de sante" The alternative safe crossing points are far from
Saving Walking/Travel Time	Significant	94%	difficult to access the bus station during rainy season, and the bridge made consistent access possible. the residences and the social-economic facilities. The average distance is about 9km from nearest village to the nearest facility. Before the bridge was constructed, many people died while crossing the river. Before the bridge was constructed, many people were injured while crossing the river. People of all ages were able to cross safely during bridge construction Since the health center is far from the alternative safe crossing point, before the bridges, some mothers were insisting on giving birth at home by preventing to cross the river. The bridges increased the economic revenue, which gave the communities the ability to pay their "mutuel de sante" The alternative safe crossing points are far from
Well- being (Health and Safety)	Significant	95%	the residences and the social-economic facilities. The average distance is about 9km from nearest village to the nearest facility. Before the bridge was constructed, many people died while crossing the river. Before the bridge was constructed, many people were injured while crossing the river. People of all ages were able to cross safely during bridge construction Since the health center is far from the alternative safe crossing point, before the bridges, some mothers were insisting on giving birth at home by preventing to cross the river. The bridges increased the economic revenue, which gave the communities the ability to pay their "mutuel de sante" The alternative safe crossing points are far from
Saving lives	Positive	93%	Before the bridge was constructed, many people were injured while crossing the river. People of all ages were able to cross safely during bridge construction Since the health center is far from the alternative safe crossing point, before the bridges, some mothers were insisting on giving birth at home by preventing to cross the river. The bridges increased the economic revenue, which gave the communities the ability to pay their "mutuel de sante" The alternative safe crossing points are far from
Decrease of injuries	Significant	97%	Before the bridge was constructed, many people were injured while crossing the river. People of all ages were able to cross safely during bridge construction Since the health center is far from the alternative safe crossing point, before the bridges, some mothers were insisting on giving birth at home by preventing to cross the river. The bridges increased the economic revenue, which gave the communities the ability to pay their "mutuel de sante" The alternative safe crossing points are far from
General improvements to pedestrian and cyclist safety	Positive	97%	People of all ages were able to cross safely during bridge construction Since the health center is far from the alternative safe crossing point, before the bridges, some mothers were insisting on giving birth at home by preventing to cross the river. The bridges increased the economic revenue, which gave the communities the ability to pay their "mutuel de sante" The alternative safe crossing points are far from
Reducing infant and maternal mortality	Moderate	98%	some mothers were insisting on giving birth at home by preventing to cross the river. The bridges increased the economic revenue, which gave the communities the ability to pay their "mutuel de sante" The alternative safe crossing points are far from
Ability to pay the health insurance (Mutuel de Sante)	Positive	98%	The bridges increased the economic revenue, which gave the communities the ability to pay their "mutuel de sante" The alternative safe crossing points are far from
Financial (Income and Cost)	Positive	92%	The alternative safe crossing points are far from
Economic ben-	Significant	99%	Pedestrian footbridges allowed farmers to bring

Motorcycle passenger travel cost	MPTC 1,433,600	Equ. 7
Motorcyclist travel cost	MTC 1,068,480	Equ. 2
Pedestrian delay cost	PDC 57,652,000	Equ. 1
Total user cost	TISC 57,652,000	

Figure 8: Table 5 :

6

Parameter' name	Parameter's Sym- bole	Value	Equation
Estimated number of bridge users crossing per day (A): people/day	A	664	N.E
Estimated number of kilos of farming goods crossing per day(B): kilos/day	B	9,960	N.E
Estimated differential sales price between selling product on one side versus newly accessed side(C): Rwf/kilo	C	15	N.E
Estimated additional kilos of products/farming goods not otherwise sold without access to other side per annum(D): kilos/annum.	D	25,550	N.E
Average price of products sold per kilo(E) Rwf/kilo	E	250	N.E
Estimated number of worker crossings per day that would otherwise not be able to access job on newly accessed side(F): Number	F	26	N.E
Estimated wages earned by workers per day that would otherwise not be able to gain access to jobs without bridge(G) RWf /day	G	1,500	N.E
Number of days that footbridge is used per year by farmers and workers(H): days	H	325	N.E
Economic benefit from farming goods(I). Rwf /day (Multiply B by C)	I	149,400	(B*C)
Additional economic benefit for products and farming goods(J). Rwf /day (Multiply D by E then divide by 365)	J	17,500	[(D*E)/365]
Economic benefit from additional worker jobs(K): Rwf /day (Multiply F by G)	K	39,000	(F*G)
Total economic benefit for farming goods and workers(L): Rwf /day (Add I + J + K)	L	205,900	(I+J+K)
Estimated economic benefit per year for this footbridge: Rwf /annum (Multiply L by H)	M	66,917,500	(L*H)
iv. Business Revenue Change			

Figure 9: Table 6 :

7

Parameter's name	Parameter	Value	Equation
number of households that would not be able to cross without the bridge when the river is flooded (Households)	HCWB	2000	
percentage area influenced by the bridge (percentage)	I	50%	
average frequency per week of patronizing businesses in the area (visit per week)	F	2	
average expenditure per household (Rwf/visit/household)	AE	700	
Impassable weeks per year (Weeks/year)	IW	16	
number of customers	IC	2000	$(WCWB * I * F)$
The business revenue increase (Rwf)	BRC	22,400,000	$(IC * AE * IW)$
d) Total Economic Benefit Per Year Per Pedestrian Footbridge.
